

Commonly associated with the medical and biotech industries for use in developing electrode pad adhesive, as well as playing a significant role in human tissue engineering, Hydrogel is an amazingly versatile conductive copolymer adhesive gel that is recently breaking ground for use in military operations. More specifically, Hydrogel is being widely used in breaching technology.

As a powerful adhesive capable of adhering to almost any surface in the most extreme of environments, Hydrogel is easily the next generation of breaching charge technology. When combined with the proper offset material, such as Amron's highly efficient and versatile rubber offset strips, Hydrogel easily supersedes traditional putty or rigger's tape. With its unique conducting property and its capability to be manipulated into various shapes and sizes, Hydrogel is the most efficient solution in building traditional or custom charges, regardless of mission intensity.
