1 INTRODUCTION AND SPECIFICATIONS

1.1 INTRODUCTION

Congratulations on purchasing the most advanced and powerful portable communicator in the diving industry! Our engineering team has integrated the latest in digital advancements to produce the industry's most intelligible and reliable diver communicators. Our built in quality that Amron is known for makes the 2830A series the most versatile and durable communicators anywhere in the world!

The AMCOM III Series is a family of full-featured hard-wired, three-diver communicators with independent microphone and earphone volume controls for the tender and each diver. All models come standard with a built-in internal charger and can be operated from 90-264 V_{AC}, an internal 12 V_{DC} battery, or an external 12 V_{DC} power source.

All models can be operated in both 2-Wire and/or Full Duplex (4-Wire) communication modes. 2-Wire and Full Duplex (4-Wire) modes can also be used simultaneously.

Only Amron offers **Microphone Auto Detection** that identifies the type of microphone each diver is using and automatically adjusts for optimum performance. This portable diving communicator has the ability to work with both dynamic and pre-amplified microphones in either 2-Wire or 4-Wire modes.

SPECIFICATIONS

Input Impedance (Each Input)	250 Ohms
Frequency Response	300 - 10000 Hz
Common Mode Rejection	40 dB Minimum
Current Drain Maximum Full Volume	3 Amps
Minimum Quiescent	0.190 Amps
Output Impedance	4 Ohm
Power Supply Voltage	12 V _{DC} Nominal (9 V _{DC} Min - 16 V _{DC} Max)
AC Power Operating Range	90-264 V _{AC} , 50-60 Hz
Sensitivity (Input)	0.5 mV
Output Power (RMS @ 4 Ohm Load, 12 VDC)	10 Watts Audio

Battery Life

Model 2830A-01	41 Hours
Model 2830A-02	29 Hours
Model 2830A-03	30 Hours
Model 2830A-05	41 Hours
Model 2830A-06	30 Hours
Model 2830A-07	29 Hours

Materials

Front Panel	Stainless Steel, Powder Coated
Enclosure	High Impact UV Resistant Plastic
Enclosure Color	Bright International Yellow

Dimensions

Length 14.5 In. (36.8 Cm)
 Width 9.0 In. (22.9 Cm)
 Height 10.0 In. (25.4 Cm)

Weight with Batteries

Model 2830A-01 18.00 Lbs. (8.16 Kg)
 Model 2830A-02 with Helium Speech Unscrambler Option 18.75 Lbs. (8.50 Kg)
 Model 2830A-03 with Wireless Tender Kit 23.10 Lbs. (10.48 Kg)
 Model 2830A-05 with MS Connectors 18.25 Lbs. (8.28 Kg)
 Model 2830A-06 with MS Connectors & Wireless Tender Option 23.35 Lbs. (10.59 Kg)
 Model 2830A-07 with MS Connectors & HSU Option 19.00 Lbs. (8.62 Kg)

Model 2830A-01

Available Models & Options:

- 2830A-01 with AC Power and Internal Charger (Shown Above)
- 2830A-02 with DSP3 Helium Speech Unscrambler Option
- 2830A-03 with 28A Wireless Tender Option
- 2830A-05 with MS Connectors
- 2830A-06 with MS Connectors & 28A Wireless Tender Option
- 2830A-07 with MS Connectors & Helium Speech Unscrambler Option

2 OPTIONS AND ACCESSORIES

The following configurations are available to customize your AMCOM III communicator. Options have to be ordered at the time of purchase or the communicator has to be returned to AMRON for the option to be installed.

2.1 OPTIONS

2.1.1 -01 AC POWER WITH INTERNAL CHARGER

Commercial style three diver communicator comes standard with AC Power, internal charger, and hand held microphone.

-02 HELIUM SPEECH UNSCRAMBLER (HSU)

The communicator has all the features of the -01 plus Amron's DSP3 Helium Speech Unscrambler (HSU) using the state-of-the-art Digital Signal Processor (DSP) technology to correct raw helium speech into clear, intelligible voice. This option includes a complex noise reduction filter to improve communications in situations with high background noise levels.

-03 WIRELESS TENDER OPTION

The communicator has all the features of the -01 plus the wireless tender option. The wireless option includes communicator master module, remote module, remote module charger, remote wireless tender headset, remote ultra-light headset, and carrying case. The wireless tender option allows the tender freedom to move around up to 200 feet from the communicator. The wireless tender option does require the divers to be wired in Full Duplex (4-Wire) mode.

-05 MS CONNECTORS FOR MILITARY USE

The communicator is equipped with 5-Pin MS style umbilical connectors for use with military umbilical lines.

-06 MS CONNECTORS & WIRELESS TENDER OPTION

The communicator is equipped with 5-Pin MS style umbilical connectors for use with military umbilical lines and the wireless option includes communicator master module, remote module, remote module charger, remote wireless tender headset, remote ultra-light headset, and carrying case. The wireless tender option allows the tender freedom to move around up to 200 feet from the communicator. The wireless tender option does require the divers to be wired in Full Duplex (4-Wire) mode.

-07 MS CONNECTORS & HELIUM SPEECH UNSCRAMBLER (HSU)

The communicator has all the features of the -05 plus Amron's DSP3 Helium Speech Unscrambler (HSU) using the state-of-the-art Digital Signal Processor (DSP) technology to correct raw helium speech into clear, intelligible voice. This option includes a complex noise reduction filter to improve communications in situations with high background noise levels.

2.2 ACCESSORIES

The following accessories are available for the AMCOM III communicator. Accessories can be ordered at any time.

2.2.1 Item No. **2401-28** AMRON HEAVY-DUTY HEADSET

The Model 2401-28 is a high quality heavy-duty Telex headset with boom microphone. It has superior sound quality and comes equipped with color-coded dual banana plugs, 6-foot (1.8-meter) cord, and mates directly to communicator.

2.2.2 Item No. **2460-28** AMRON STANDARD HEADSET

The Model 2460-28 is a light and comfortable headset designed for extended wear at an economical price. It comes equipped with color-coded, dual banana plugs that mate directly to AMCOM diver communicators. The spiral cord can extend up to 8 feet (2.4 meters).

2.2.3 Item No. **2405-28** AMRON PUSH-TO-TALK MICROPHONE

The Model 2405-28 is a hand-held, noise-canceling, push-to-talk microphone that provides excellent sound quality to the diver. It comes equipped with a spiral cord that can extend up to 6 feet (1.8 meters).

2.2.4 Item No. **2822-28** AMRON REMOTE WALK-AND-TALK MODULE

Designed for Full Duplex (4-Wire) applications, the Model 2822-28 provides the tender with mobility around the dive site while maintaining communications with the diver. It comes equipped with a small clip-on belt module that contains the connectors for the headset, and 25 feet (7.6 meters) of lightweight flexible cable. Custom cable lengths are available upon request.

2.2.5 Item No. **2821-28** AMRON REMOTE PUSH-TO-TALK MODULE

Designed for 2-Wire applications, the Model 2821-28 provides the tender with mobility around the dive site while maintaining communications with the diver. It comes equipped with a small clip-on belt module that contains a push-to-talk switch, connector for the headset, and 25 feet (7.6 meters) of lightweight flexible cable. Custom cable lengths are available upon request.

2.2.6 Item No. **2829-11** AMRON WIRELESS TENDER HEADSET

A heavy-duty single ear muff headset combined with the remote wireless belt module that is compatible with the 28A Wireless Tender option. Additional headsets can be ordered to allow other crew members, supervisors, crane operators, etc. to monitor the conversation.

3 CONTROLS AND CONNECTIONS

Before using the AMCOM III series portable diver communications system, you should familiarize yourself with its operating controls and connections. Improper use of controls and connections will deprive the user of the full benefits of this communication system.

3.1 TENDER CONTROLS & CONNECTIONS

- 3.1.1 **POWER SWITCH** – This switch controls power to the unit.
- 3.1.2 **SPEAKER SWITCH** – This switch allows the tender to turn off the speaker. If the tender is using a headset, it may be necessary to turn off the speaker in order to prevent acoustic feedback.
- 3.1.3 **PUSH-TO-TALK (ALL DIVERS)** – This button allows the tender to talk to all the divers when operating in the 2-Wire mode. It is not necessary to use this control in the Full Duplex (4-Wire) mode. When using Full Duplex mode, this control allows the tender to interrupt the divers by forcing them into listen only mode.
- 3.1.4 **MICROPHONE VOLUME** – This control sets the level for the tender's microphone and/or PANEL MICROPHONE. Rotate knob clockwise to increase the tender's volume to all the divers.
- 3.1.5 **EARPHONE VOLUME** – This control sets the volume for the tender's earphone and/or PANEL SPEAKER. Rotate this knob clockwise to increase the volume from all the divers
- 3.1.6 **BATTERY CONDITION INDICATOR** – A steady GREEN light indicates battery charge level is good. Blinking GREEN light indicates battery charge level is at a low level with less than 3 hours of running time available. Steady RED light indicates battery charge level is below the level necessary to guarantee proper operation.
- WARNING: When BATTERY CONDITION INDICATOR is steady RED light, the batteries should be replaced or recharged immediately.**
- 3.1.7 **PANEL SPEAKER** – A waterproof, acoustic horn speaker that allows the tender to listen to the divers. The volume level is controlled by the EARPHONE VOLUME control and it can be turned off using the SPEAKER SWITCH.
- 3.1.8 **PANEL MICROPHONE** A water-resistant condenser microphone that allows the tender to talk to the divers using the PUSH-TO-TALK BUTTONS. The volume level is controlled by the MICROPHONE VOLUME controls. The PANEL MICROPHONE is muted when the SPEAKER SWITCH is turned off.

WARNING: Do not plug or cover the PANEL MICROPHONE hole. This may reduce the tender-to-diver communications or damage the microphone requiring replacement.

- 3.1.9 **TENDER HEADSET JACK (BLACK)** – This is the dual banana jack (color-coded black) that functions as both an output (earphone) and input (microphone) for the tender as controlled by the PUSH-TO-TALK BUTTON and PUSH-TO-TALK JACK. Using this connection, the tender can be wired in either 2-Wire or Full Duplex (4-Wire) mode regardless of the mode used for the diver.

To connect the tender in the Full Duplex (4-Wire) mode, connect the earphone (black) banana plug of the headset to this jack and the microphone (red) to the TENDER MICROPHONE jack (red) as shown in the wiring diagram in section 3.6. In this mode, the tender does not have to use the PUSH-TO-TALK BUTTON to communicate with a diver who is also connected in the Full Duplex (4-Wire) mode. This configuration can be used even if the diver is connected in 2-Wire mode. In that situation, the tender is required to use the PUSH-TO-TALK BUTTON or PUSH-TO-TALK JACK.

The headset microphone is always active, which means that there can be acoustic feedback between the PANEL SPEAKER and the microphone if the tender is near the communicator. To prevent this, the PANEL SPEAKER can be turned off using the SPEAKER SWITCH. Another option is to move the tender away from the communicator by using the Amron Model 2822-28 Walk-and-Talk Module accessory. This allows the tender to communicate while other members of the surface crew listen using the PANEL SPEAKER. This module comes with 25 feet (7.6 meters) of cable (custom cable lengths are available).

The tender can also be connected in 2-Wire mode by stacking both the earphone (black) and microphone (red) banana plugs into this jack as shown in the wiring diagram in section 3.5. The diver does not have to be connected in 2-Wire mode if the tender is in 2-Wire mode. In order to talk to the diver, the tender must use either the PUSH-TO-TALK BUTTON or PUSH-TO-TALK JACK. Since the headset microphone is not active until one of the push-to-talk methods is used, there is no chance for acoustic feedback to occur and surface conversation or noise is not transmitted to diver and the PANEL SPEAKER can be left on. This may, for some situations, make for a better overall diving experience. If the tender requires more mobility at the dive site, the Amron Model 2821-28 Remote Push-to-Talk Module can be used to extend the headset cable. It includes a push-to-talk button on a clip-on belt module and comes standard with 25 feet (7.6 meters) of cable (custom cable lengths are available).

The tender may also use the optional Amron Model 2405-28 Push-to-Talk Microphone. This microphone comes with two color-coded banana plugs. The black plug goes into the TENDER HEADSET jack and the yellow plug goes in the PUSH-TO-TALK JACK as shown in the wiring diagram in section 3.7. To communicate with the diver, the tender presses the button on the side of the microphone. There is no chance of acoustic feedback since the PANEL SPEAKER is cut off when the tender uses the microphone. When using the Push-to-Talk Microphone, the SPEAKER SWITCH must be turned on in order to hear the diver.

- 3.1.10 **TENDER MICROPHONE JACK (RED)** – This is a dual banana jack (color-coded red) that functions as the microphone input from the tender's headset. It is only used if the tender is in Full Duplex (4-Wire) mode.
- 3.1.11 **PUSH-TO-TALK JACK (YELLOW)** – This is a dual banana jack (color-coded yellow) that allows for remote keying of the push-to-talk function of the communicator. It is use by the Push-To-Talk Microphone (Amron Model 2405-28) and the Remote Walk-And-Talk Module (Amron Model 2822-28).

The difference between using the PUSH-TO-TALK JACK and PUSH-TO-TALK SWITCH is that the switch allows the tender to communicate using the PANEL MICROPHONE. If both are used at the same time, the PANEL MICROPHONE is active. This allows another crew member to talk to the diver using the PANEL MICROPHONE even if the tender is away from the communicator using the Remote Push-to-Talk Module in 2-Wire mode.

- 3.1.12 **EXTERNAL BATTERY JACK** – The communicator can be powered using an external battery or power supply via the two color coded TIP jacks. The red TIP jack is the positive power input and the black is the negative power input. The input voltage must be between 9 and 15 V_{DC} and must be able to supply a peak current of 3 Amps for proper operation. The following warnings need to be heeded when using the EXTERNAL BATTERY JACK. A minimum wire size of 18 AWG and maximum wire run of 3 feet (1 meter) is recommended.

WARNING: If you use an external power supply, the maximum voltage cannot exceed 16 Volts.

- 3.1.13 **RECORDER** – This is a single RCA Phono jack (color-coded black) that provides a transformer isolated of both the diver and tender communications. It is designed to drive the standard line-level inputs of audio or video recorders with input impedances as low as 600 Ohms.
- 3.1.14 **AC POWER** – The AC power cord is located in the option panel located on right side of the communicator front panel. The option panel has an AC POWER LED to identify the presence of AC power. When the communicator is plugged into AC power, the LED will be on regardless of the POWER SWITCH. The internal battery charger has a universal input AC voltage range from 90-264 V_{AC} over a frequency range from 50-60 Hz. No operator adjustment is required.

3.2 DIVER CONTROLS & CONNECTIONS

- 3.2.1 **DIVER EARPHONE VOLUME** – The 2830A series has separate earphone volume controls for each diver. This allows the tender to set the best individual volume for each diver.
- 3.2.2 **DIVER MICROPHONE VOLUME** – The 2830A series has separate microphone volume controls for each diver. This sets amplification level of each diver's microphone signal controlling that diver's volume to both the tender and the other diver.

3.2.3 **DIVER PUSH-TO-TALK** – There is a separate PUSH-TO-TALK button for each diver. Normally used in 2-Wire mode, this control allows the tender to talk to only one of the divers. The diver selected will hear both the tender and the other diver allowing crosstalk between the divers controlled by the tender. It can be used in Full Duplex (4-Wire) to cut off the microphone of an individual diver.

3.2.4 **DIVER MICROPHONE CONNECTION (RED)** – This is a dual 5-way binding post jack (color-coded red) that functions as both an output (earphone) and input (microphone) for the diver as controlled by the PUSH-TO-TALK BUTTON and PUSH-TO-TALK JACK. Using this connection, the diver can be wired in either 2-Wire or Full Duplex (4-Wire) mode regardless of the mode used for the diver.

To connect the diver in 2-Wire mode, connect both the diver microphone and earphone to this jack. If the diver umbilical uses banana plugs, simply stack both plugs into this jack as shown in the wiring diagram in section 3.5. In this mode, the diver microphone will be active and heard on tender headset and/or PANEL SPEAKER unless the PUSH-TO-TALK BUTTON or PUSH-TO-TALK JACK is used. When a pre-amp microphone is used in the 2-Wire mode setup, it is required to have special speakers supplied only by Amron. Contact Amron for more information.

To connect the diver in Full Duplex (4-Wire) mode, connect the diver microphone to this jack and the diver earphone the DIVER EARPHONE jack as shown in the wiring diagram in section 3.6. The diver can use this mode even if the tender is wired in 2-Wire mode.

3.2.5 **DIVER EARPHONE CONNECTION (BLACK)** – This is a dual 5-way binding post jack (color-coded black) that functions as the output for the diver's earphone. It is only used when the diver is in Full Duplex (4-Wire) mode.

3.3 HELIUM SPEECH UNSCRAMBLER (DSP3) CONTROLS

The controls for the DSP3 Helium Speech Unscrambler (HSU) are located in the options panel on the right side of the front panel as shown below.

3.3.1 **ON/OFF SWITCH** – Allows the selection of air (OFF) or helium (ON) operation. In the OFF position, the divers' microphone signal bypasses the HSU. In the ON position, the microphone signals are routed to the HSU and the tender can adjust the controls as necessary.

3.3.2 **TREBLE BOOST** – Selects the amount of gain added to the High Frequency (HF) portion of the divers' microphone signals. This compensates for the HF drop-off in the sensitivity of most microphones. The TREBLE BOOST feature allows for optimum frequency enhancement and improved intelligible speech from the diver's voice.

- 3.3.3 **DEPTH CONTROL** – Selects the amount of frequency correction performed by the HSU to produce intelligible speech. This control uses a multi-turn potentiometer and is equipped with a turn counting knob and lock. Once the desired setting is reached, the lock can be used to prevent accidental changes to this control.
- 3.3.4 **NOISE REDUCTION FILTER** – The Noise Reduction Filter (NRF) uses a complex Digital Signal Processor algorithm based on a statistical-model of human voice activity to capture the background noise and reduce it without affecting the divers' speech. The noise level can be reduced by up to 17 dB.

3.4 WIRELESS TENDER (28A) CONTROLS

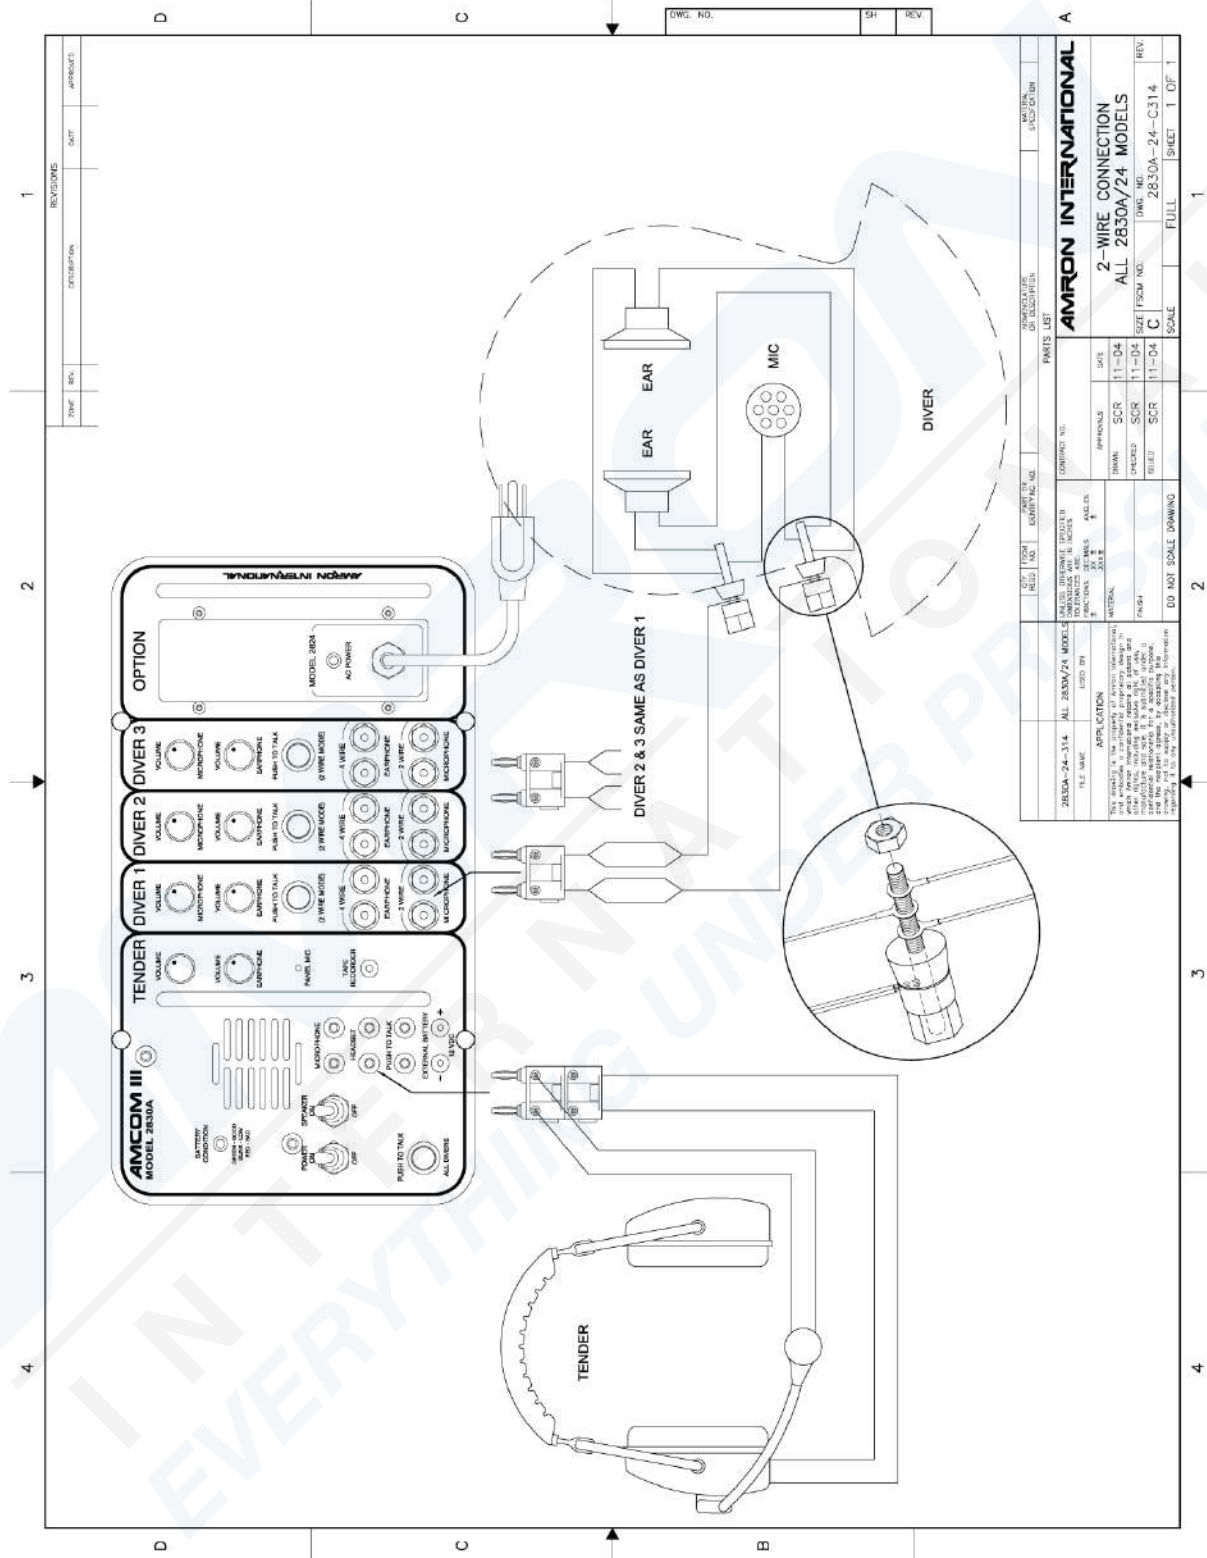

This option is mounted in the right hand side of the front panel. This Wireless Tender Option is for four-wire (Full Duplex) operation only. System comes standard with a remote wireless tender module.

- 3.4.1 **WIRELESS OPTION** – Comes standard with antenna and power on/off switch. The "ON/OFF" switch powers the wireless PC card inside the communicator. The antenna has a swivel and tilt that allows the antenna to be folded down during shipment. For operation, the antenna should be pointing upwards. For installations where the Diver Communicator is located inside a structure, there is an optional Remote Antenna kit available. This kit allows the antenna to be located outside the structure for maximum effective range.

IMPORTANT: When the wireless option is not used, turn the option panel switch to "OFF". When option panel switch is turned "ON", the wireless remote should be "ON". Otherwise, a static noise may be heard through the communicator's panel speaker as it scans for available Remote Wireless Tender.

- 3.4.2 **REMOTE WIRELESS TENDER MODULE** – This module comes standard with an internal rechargeable battery. Headset and external 110V_{AC} charger jacks are located on remote module.
- 3.4.3 **ON/OFF-VOLUME CONTROL** – Adjusts the listening volume and turns the unit "OFF" when it is turned completely upwards.
- 3.4.4 **TALK PUSH BUTTON** – This button is located on the top of the unit and is labeled TALK. When it's first turned on, the Remote Wireless Tender Module is in Standby Mode (listen only) as indicated by the red LED closest to the TALK button. When the button is pressed, the Remote Wireless Tender Module is in "Talk Mode" (listen and talk, full duplex) and the LED turns green. Pressing the TALK button toggles between the two modes. Multiple Remote Wireless Tender Modules can be in the Standby (listen only) mode at the same time. Only one module can be in the talk mode.
- 3.4.5 **HEADSET JACK** – Located on the side opposite the ON/OFF-Volume Control. Plug the remote wireless headset to this jack.
- 3.4.6 **CHARGE JACK** – Located on the side next to the ON/OFF-Volume Control. Plug the remote wireless charger to this jack.

4 OPERATION

The AMCOM III portable diver communicators are supplied in a durable yellow enclosure. To open the enclosure, release the two latches on the front of the unit and raise the lid. The lid of the communicator can be removed by sliding the lid to the side.

The AMCOM III panels are graphically divided into sections: Tender Controls, Diver Controls, and Options. Items within these areas are functions or controls relating to the Tender, Diver(s) or Optional items.

WARNING: *When operating your Amron Diver Communicator from AC mains, it is critical to use a Ground Fault Circuit Interrupter (GFCI) and/or isolation transformer for tender and diver safety. Surges and spikes are common on AC lines found onboard ships, from local generators, or at the end of long extension lines. These spikes can exceed 1kV! Such spikes can be high enough to cause the input fuses on the power supply to blow and, in extreme cases, actually damage the charging circuitry. Amron uses a medical grade power supply to isolate such faults to ensure that they will not cause a safety issue for the diver or tender. Amron cannot guarantee that non-Amron power supplies meet the same high standards and strongly advises against using any such device to power your diver communicator.*

4.1 BATTERY CHARGING

To charge the battery after use, simply connect power cord to an AC outlet rated from 90-264 V_{AC}, 50-60 Hz. The charger will automatically adjust to the input voltage. It is recommended that the customer purchases a power adapter approved for the country of use.

The unit should be placed on charge and left on charge until the unit is to be used again. This ensures the unit will always be ready to use, and the batteries are fully charged. The charger is designed not to damage the batteries when left on continuous charge. Full charge will occur in ten hours (depending on the battery age and the surrounding temperature). If the unit is in constant use (daily) it is recommended the unit be left on charge during the weekend to top off the batteries. Batteries must be recharged periodically, a minimum of at least once every six months.

An internal 12V_{DC} sealed lead-acid battery is supplied standard for backup operation in the event of a loss of AC power. The switch over to battery operation is completely automatic, and occurs whenever AC power is interrupted. The internal 12V battery is maintained at full charge while the unit is operating from AC power. AC power indicator on the option panel confirms the presence of AC power.

Operating time for the rechargeable 12V battery depends upon the age of the battery. A sealed lead-acid battery has a life of 300 cycles, or 3 years. This battery does not have memory and can be placed on charge at any time.

NOTE: Do not continue to operate rechargeable battery below the low battery condition or permanent damage will occur. When the battery condition indicator turns to red, turn the unit off and charge batteries.

4.2 BATTERY CONDITION

4.2.1 POWER ON – BATTERY CHECK

Turn power switch “ON” and observe the battery condition indicator. The battery indicator will display the condition of the battery.

- “STEADY GREEN” light indicates the battery has sufficient voltage to operate the unit.
- “BLINKING GREEN” light indicates the battery is low and will need charging shortly, three hours of operating time remain.
- “STEADY RED” light indicates the battery voltage is too low to operate the unit. Communication should stop.

NOTE: A battery that has not been used for a period of time will display a higher voltage state when initially turned on. This will rapidly dissipate. This condition is known as a surface charge. When the battery is placed under a load the voltage will fall rapidly. It is a good idea to leave the unit on for five minutes before relying upon the battery condition indicator.

4.3 BATTERY INSTALLATION

The 2830A series communicators are supplied with a single 12V_{DC} gel-cell, sealed lead-acid battery. To remove and install the battery, remove the four brass thumb screws from the front panel and lift unit out of the case. Set brass screws aside in a safe place where they won't be lost. Set unit on flat stable surface with front panel facing up. Remove two screws on each side of the chassis. Lift out radio using the handles and set it on its right side (side away from speaker). The 12V battery is now accessible. Lift out battery and remove color-coded slide terminals. Install the battery and close unit in the reverse order.

4.4 MODES OF OPERATION

The 2830A series have the ability to operate in either 2-Wire or Full Duplex (4-Wire). Both the diver and tender can be connected in either mode and a combination of modes can be used. If either the diver or the tender is wired in 2-Wire mode, the tender must use a push-to-talk, either the PUSH-TO-TALK ALL SWITCH or PUSH-TO-TALK JACK, when talking to the diver.

2-Wire communication is defined as a single communication path, normally the diver is the priority signal path – tender listens to diver. Signal reversing is accomplished by pushing the PUSH-TO-TALK BUTTON – diver hears tender. Often times a 4-conductor communication cable is used with 2 wires tied together as a pair for redundancy, this is still a 2-Wire system. Since only one person can talk at a time, there is a level of discipline that goes with using 2-Wire mode in order to obtain clear communication. One advantage of 2-Wire is that the tender's microphone is not active unless one of the two push-to-talk controls, PUSH-TO-TALK BUTTON or PUSH-TO-TALK JACK, are active. This eliminates any possible acoustic feedback between the tender's microphone and the PANEL SPEAKER. It also prevents noise from the surface reaching the diver and allows the tender to communicate with other members of the surface crew without involving the diver.

Full Duplex (4-Wire) communication is defined as a dual communication path, a signal path (a pair of wires) for up-link and a signal path (a pair of wires) for down link. A common example of Full Duplex communication is the telephone. Full Duplex (4-Wire) has the advantage of natural communication without having to use the PUSH-TO-TALK BUTTON. This keeps the tender's hands free to perform other task. It does not require the same level of discipline to achieve clear communications that 2-Wire does. It has the advantage that neither the diver nor the tender are cut off when the other is talking. Because the diver's microphone is not connected in parallel with the earphone, the diver is louder and potentially clearer in Full Duplex (4-Wire) mode.

4.4.1 2-WIRE OPERATION

For communicator model 2830A (Binding Post Connectors) - To connect the diver in 2-Wire mode, connect the communication umbilical wires to the DIVER MICROPHONE (RED) binding post jack on the communicator as shown in the wiring drawing in section 3.5. If the umbilical uses a banana plug, simply insert the plug into the binding post jack. Verify that it is firmly and completely seated. This may require that the external plastic nut be tightened down. If the umbilical uses bare wires, loosen the external plastic nut of the binding post jack. Either insert the bare end of the wire into the hole in the metal shaft of the binding post or firmly wrap the wire around the shaft. Tighten the nut until the bare wire is firmly fastened by the nut. The nut should not be fastened on the insulation of the wire nor should any of the bare wires touch.

For communicator models 2830A-05 & 2830A-06 (5-Pin MS Connectors) - Connect the communications cable from the divers umbilical (hat/helmet) to Diver 1, Diver 2 and Diver 3, Umbilical MS Connector Pin A & B. Pin A should have one of microphone wires and one of earphone wires, same thing for Pin B. Wires should be well soldered to the mating connector. Pin A & B wires should not touch each other.

The tender can operate in the 2-Wire mode without a headset or push-to-talk microphone. When the tender wants to talk to the diver, he presses the PUSH-TO-TALK BUTTON on the front panel and speaks clearly into the PANEL MIC. When done speaking, the tender releases the PUSH-TO-TALK BUTTON to allow the diver to communicate.

When the tender uses a headset, follow the wiring diagram in section 3.8. Please note that when in the 2-Wire mode, the tender must press the Push-to-Talk Switch on the front panel to be heard.

When using the Amron Model 2405-28 Push-to-Talk Microphone, follow the wiring diagram in section 3.7. When the tender presses the push-to-talk button on the side of the microphone and speaks clearly at a distance of between 1 and 2 inches (25 to 51 mm). When done speaking, the tender releases the push-to-talk button to allow the diver to communicate.

If using the Amron Remote Walk-and-Talk, Model 2821-28, the tender may press the Push-To-Talk Switch on the belt module to speaker to the divers.

4.4.2 4-WIRE OPERATION

To connect the diver in Full Duplex (4-Wire) mode, connect the communication umbilical wires to the DIVER MICROPHONE and DIVER EARPHONE jacks as shown in wiring diagram in section 3.6. If the umbilical uses a banana plug, simply insert the plug into the correct binding post jack. Verify that it is firmly and completely seated. This may require that the external plastic nut be tightened. If the umbilical uses bare wire ends, loosen the external plastic nut of the binding post jack. Either insert the bare end of the wire into the hole in the metal shaft of the binding post or firmly wrap the wire around the shaft. Tighten the nut until the bare wire is firmly fastened by the nut. The nut should not be fastened on the insulation of the wire nor should any of the bare wires touch. The diver microphone will be louder in Full Duplex (4-Wire) mode than in 2-Wire mode. This can be a significant advantage when using longer dive umbilical cables.

For communicator models 2830A-05 & 2830A-06 using 5-Pin MS Connectors, connect the two microphone wires to Pins A & B, two earphone wires to Pins C & D, and ground to Pin E on MS Connector. Wires should be well soldered to the mating connector.

To use Full Duplex (4-Wire) mode, the tender must use a headset and connect per the wiring diagram in section 3.8. When not wearing a headset, the tender will have to use the PUSH-TO-TALK BUTTON to communicate to the divers. The tender can also use the PUSH-TO-TALK BUTTON to cut off the AUDIO AUXILIARY INPUT signal from the diver even if the tender is connected in Full Duplex (4-Wire) mode. When the tender uses a headset, the SPEAKER SWITCH should be turned off to prevent acoustic feedback.

Acoustic feedback can also be avoided by moving the tender away from the communicator by using the Amron Model 2822-28 Remote Walk-and-Talk Module with 25 foot long cable.

NOTE: Acoustic feedback may occur when operating with a standby diver who does not have his hat/helmet on. On the 2830A series, this can be avoided by turning his DIVER MICROPHONE VOLUME control down. This cuts off his microphone but will enable him to monitor the diver/tender conversation via his earphone.

4.5 VOLUME CONTROLS (2-Wire)

- 4.5.1 Turn power switch to ON, turn speaker switch to ON.
- 4.5.2 If a headset is available, the tender should use it initially to talk and listen to himself. If adjustments are required, increase or decrease volume (controls). This will establish a system volume level.
- 4.5.3 If a headset is not available, adjust all volume controls to mid-scale. Tender has to depress PUSH-TO-TALK BUTTON in order to talk to divers. One diver at a time, the Tender and Diver talk to each other during Tender adjusting volume controls as below:

- 4.5.4 Tender - While diver is speaking, adjust Tender Volume Control to a comfortable level.
- 4.5.5 Diver - Depress the push-to-talk switch and while talking into the panel microphone, adjust diver volume control to a comfortable level for the diver.

4.6 VOLUME CONTROLS FULL DUPLEX (4-Wire)

- 4.6.1 The upper row of volume controls set the microphone volume, the lower row of volume controls set the earphone volume. Tender controls are considered master controls. The optimum settings are when controls are closely matched, with differences compensating for differences in diver levels.

Turn unit on and adjust volume controls as follows:

- 4.6.2 Tender should don headset and talk to himself. If adjustments are required, increase or decrease Tender volume (controls). This will establish a system volume level.
- 4.6.3 Tender (Volume Controls)
- Earphone – Divers talk, while tender adjusts to a comfortable listening level.
 - Microphone – Tender talks and divers determine a comfortable listening level, having the tender adjust as needed.

4.7 HELIUM SPEECH UNSCRAMBLER OPTION

4.7.1 HELIUM SPEECH UNSCRAMBLER (DSP3)

The Helium Unscrambler option is installed into the option panel located on right side of the communicator. A Communicator with this option accommodates a wide range of operating depths. This state-of-the-art digital design can accommodate a multitude of functions ranging from the correction of the diver's raw helium speech to normal intelligible voice levels, advance treble boost and complex noise reduction filters (NRF).

Diver radios configured with this option are only supplied with the AC power option. This is due to the power requirements of the Unscrambler option. The radio can be operated in the air mode by turning the HSU off.

Amron's advanced NOISE REDUCTION FILTER (NRF) incorporates a complex DSP algorithm which filters out background noise while allowing the diver's speech to be clear and intelligible. Amron NRF automatically captures the frequency spectrum of applied background noise within the audio frequency bandwidth and reduces it without affecting the diver's speech.

The Treble Boost Control provides a means of adjustment to enhance the diver's microphone performance. The treble boost feature allows for optimum frequency enhancement and improved intelligible speech from the diver's voice.

The Depth Control is used to change the amount of shift in the frequency of the diver's voice. The depth control is advanced as the diver's depth increases. There is a certain amount of interaction between the controls, and also a difference between diver voices, therefore it is necessary to tune the unit to the diver. Intelligibility is the desired result; each operator will find a combination which works best. The frequency shifting algorithm changes the amount of correction to the raw helium speech. The Depth Control is a multi-turn control with a locking feature. This allows the tender to finely adjust the level necessary and lock the control to prevent accidental adjustments.

At power-up, all the controls should be in the minimum (far left) position. Have the diver speak and adjust the DEPTH CONTROL as necessary to achieve the best speech quality. Then adjust the TREBLE BOOST as necessary to improve the quality. There is some interaction between these controls so you may have to go back and adjust the DEPTH CONTROL. Once the best speech quality settings are found, the NOISE REDUCTION FILTER can be adjusted, if necessary, to reduce any background noise.

Operating in 2-Wire and Full Duplex (4-Wire) modes is possible with the HSU. In 2-Wire mode, the tender's push-to-talk switch interrupts signals from the diver. In Full Duplex mode, the tender will hear the diver at all times and tender must use a headset to talk to the divers without using the push-to-talk switch. Use of a headset to monitor helium speech is strongly recommended to enhance intelligibility.

4.8 WIRELESS TENDER OPTION

4.8.1 WIRELESS TENDER (28A)

This option is installed in the right-hand section of the Diver Communicator's front panel. Amron's Full Duplex Wireless Tender is designed to allow the top-side tender to communicate to divers with hands-free operation. This allows the tender to check equipment and perform other tasks while still maintaining constant contact with the divers. This option can also be used in the 2-Wire mode to listen to the diver-tender communications.

The Wireless Tender Option operates on one of 40 frequency channels. This allows multiple systems to operate in close proximity without interfering with each other. There is a master transceiver located inside the diver communicator. The channel is selected by setting a set of eight dip switches (located under the battery). Both the remote and master transceivers must have the same dip switch setting. The factory default setting is 1,1,1,1,0,0,0,1 (1 is ON). In order to change the channel of operation, it is required to apply changes to both units (master and remote). Amron recommends that the channel be changed by a trained technician.

Additionally, 2829-11 Wireless Headset and Transceiver Kits can be purchased for use with the AMCOM as standby "listen only" devices. Only one transceiver can be used to talk and listen to the divers at any one time but any number of transceivers can be used in listen-only mode. The transceiver models operate at a frequency of 2.40 to 2.46 GHz using frequency modulation. They have a range of 200 feet (61 meters) with clear line-of-sight.

The remote unit (transmitter/receiver) is housed in a rugged plastic casing that can be clipped to a belt or slipped into a pocket. A single charge of the NiMH battery from the included AC adapter is capable of operating (transmitting and receiving) continually for up to 5 hours. In standby (listen only) mode, the battery will last for up to 8 hours. The standard headset is a tough over-the-ear single ear muff design with adjustable boom microphone.

Operation of the unit is automatic; speaking into the remote unit transmits a RF signal to the diver communicator. The diver communicator sends the signal down the umbilical to the diver. When the diver speaks, the signal is sent up the umbilical to the diver communicator. The signal is then transmitted as a RF signal to the remote module(s).

IMPORTANT: When the wireless option is not used, turn the option panel switch to "OFF". When option panel switch is turned "ON", the wireless remote should be "ON". Otherwise, a static noise may be heard through the communicator's panel speaker as it scans for the available Remote Wireless Tender.

OPERATION: Turn option power switch to "ON", turn remote unit "ON/OFF" Volume to "ON", set remote unit to Talk Mode (press the Talk Button is once) and plug headset to remote unit.

5 MAINTENANCE AND TROUBLESHOOTING

The following section describes the procedures for checking the operation of your diver communicator, general maintenance procedures, and how to troubleshoot common problems.

5.1 FULL DUPLEX (4-Wire) CHECK

This procedure checks the communicator functions in the Full Duplex (4-Wire) mode.

1. Set all volume controls to the mid-scale (halfway) position.
2. Turn the SPEAKER SWITCH off to avoid acoustic feedback.
3. Turn on the communicator and verify the BATTERY CONDITION INDICATOR is on or blinking. If the LED does not come on at all, then replace or recharge the battery. If that does not resolve the problem, then go to the troubleshooting section to determine the cause.
4. Identify the microphone and headset leads. When using an Amron headset, the microphone is the red banana plug and the headset is the black banana plug.
5. Plug the microphone lead into the TENDER MICROPHONE (red) jack and the headset lead into the TENDER HEADSET (black) jack.
6. Don the headset and talk into the microphone. You should be able to hear yourself in the headset. Adjust the DIVER TO TENDER VOLUME control and verify the level can be adjusted to a comfortable level.

7. Move the headset microphone lead to the DIVER MICROPHONE (red) jack. Talk into the microphone. You should be able to hear yourself in the headset. Adjust the DIVER TO TENDER VOLUME control and verify that the level can be adjusted to a comfortable level.
8. Move the headset lead to the DIVER EARPHONE (black) jack. Talk into the microphone. You should be able to hear yourself in the headset.
9. This completes the check of the Full Duplex (4-Wire) function of the communicator. If at any point in the test you were not able to hear yourself in the headset as indicated by the test, refer to the troubleshooting section to determine the cause.

5.2 2-WIRE CHECK

This procedure checks the communicator functions in the 2-Wire mode.

1. Set all the volume controls to the mid-scale (halfway) position.
2. Turn the SPEAKER SWITCH off to avoid acoustic feedback.
3. Turn on the communicator and verify the BATTERY CONDITION INDICATOR is on or blinking. If the LED does not come on at all, then replace or recharge the battery. If that does not resolve the problem, then go to the troubleshooting section to determine the cause.
4. Identify the microphone and headset leads. When using an Amron headset, the microphone is the red banana plug and the headset is the black banana plug.
5. Plug the microphone lead into the TENDER HEADSET (black) jack and the headset lead into the DIVER MICROPHONE (red) jack.
6. Don the headset. Talk into the microphone while pressing the PUSH-TO-TALK BUTTON. You should be able to hear yourself in the headset. Adjust the TENDER TO DIVER VOLUME control and verify that the level can be adjusted to a comfortable level.
7. Unplug the microphone lead. Turn on the SPEAKER SWITCH. Press the PUSH-TO-TALK BUTTON while speaking into the PANEL SPEAKER. You should be able to hear yourself in the headset. Adjust the TENDER TO DIVER VOLUME if necessary and verify that the level can be adjusted to a comfortable level.
8. Plug the microphone lead into the TENDER HEADSET (black) jack. Short the PUSH-TO-TALK JACK (yellow) with a short piece of wire. Talk into the microphone and verify that you hear yourself in the headset. Remove the short. Turn off the SPEAKER SWITCH.
9. Move the microphone lead to the DIVER MICROPHONE (red) jack and move the headset lead to the TENDER HEADSET jack.
10. Talk into the microphone and verify you can hear yourself in the headset. The PUSH-TO-TALK BUTTON should not be pressed. Adjust the DIVER TO TENDER.

5.3 GENERAL MAINTENANCE

The AMCOM III diver communicator is designed to provide years of continuous, failure-free service when properly used and maintained. There are a few important things that the user can do to extend the life of their equipment

1. Handle the diver communicator with care. Do not throw it around or drop it. Select a work area where the communicator and wire connecting to it are out of everyone's way so it is not knocked over.
2. Clean the communicator after use or when needed. If the equipment is on an extended work program, have the tender clean the equipment during slow work periods. Rinse off salt deposits with fresh water. Clean the diver connections with a mild vinegar and water solution using a soft brush. Rinse off the connectors with water after cleaning.

5.4 RECOMMENDED MAINTENANCE SCHEDULE

The following sections outline the recommended scheduled maintenance for the communicator and communicator.

5.4.1 DAILY MAINTENANCE

Wipe off any accumulated salt or salt spray on the front panel or connectors using a clean, damp cloth. Pay particular attention to where the various front panel components attach to the panel. Inspect the outer case for any damage.

5.4.2 WEEKLY MAINTENANCE

Wipe off any accumulated salt or salt spray on the front panel or connectors using a clean, damp cloth. Pay particular attention to where the various front panel components attach to the panel. Inspect the outer case for any damage.

- Inspect the PUSH-TO-TALK BUTTON, binding posts and volume controls for smooth operation.
- Inspect the case lid O-ring for any damage and replace if necessary.

5.4.3 6 MONTH CHECK

Wipe off any accumulated salt or salt spray on the front panel or connectors using a clean, damp cloth. Pay particular attention to where the various front panel components attach to the panel. Inspect the outer case for any damage.

- Inspect the PUSH-TO-TALK BUTTON, binding posts and volume controls for smooth operation.
- Inspect the case lid O-ring for any damage and replace if necessary.
- Inspect the front panel gasket for any damage and replace if necessary.
- Recharge the battery.
- Perform the 2-Wire and 4-Wire (Full Duplex) system checks as described in sections 5.1 & 5.2.

5.4.4 YEARLY CHECK

For maximum service life, it is recommended that the diver communicator be sent back to Amron for a yearly check.

5.4.5 LONG TERM STORAGE

If the diver communicator is to be stored for a period greater than 30 days, it is recommended that it be stored in a cool dry location. Make sure that the POWER SWITCH is turned off during storage. The communicator should be stored with power cord connected to AC Power to ensure that the communicator will be fully charged and ready to use when needed.

5.5 TROUBLESHOOTING

Most problems are usually simple issues that can often be found by careful inspection of the diver communicator, diving umbilical, and diver wiring. The following section will describe the troubleshooting procedure for several common issues. If these sections do not cover your particular issue, it is recommended that the diving umbilical be disconnected from the diver communicator and the check-out procedures in section 5.1 be conducted. If the diver communicator passes the check-out procedures then the issue is most likely in the umbilical connections, the umbilical itself, or the wiring of the diver's hat/helmet.

5.5.1 CONNECTION ISSUES

Most diver communicator problems are caused by bad connections. Making good connections will result in years of good communications. For longer life, all connections should be soldered and copper wire must be tinned. It is strongly suggested that dual banana plugs be used topside to provide convenient and secure connections.

All cable splices must be soldered. Splices should be staggered and covered with shrink tubing (preferably shrink tubing with an adhesive sealant) and a general splice cover to protect the connections. Potting the splices to create a reliable splice is preferred but not necessary to create a reliable splice.

5.5.2 LOW BATTERY INDICATION

The BATTERY CONDITION INDICATOR indicates the battery level or state-of-charge by monitoring the battery voltage. The battery voltage can be measured independently using a Voltmeter by measuring the voltage across the EXTERNAL BATTERY JACK. The voltage has to be 9 Volts or greater for the communicator with rechargeable battery to operate. It is recommended that the communicator be recharged for at least 10 hours if the measured voltage is less than 12 Volts (depending on the age of the battery and the surrounding temperature). If the BATTERY CONDITION INDICATOR indicates a low (blinking LED) or bad (off LED) after charging, then either the battery is bad and needs to be replaced or the charger has malfunctioned.

5.5.3 UNIT NOT OPERATING

The most common reason that a diver communicator appears to be dead when the POWER SWITCH and SPEAKER SWITCH are turned on is a bad or loose battery. Check the battery per section 4.2.1. If the battery is good, then disconnect any diving umbilical and perform the communicator check out procedure per section 5.1.

If the battery and battery connections appear good and the communicator fails the check-out procedure, then remove the screws holding the front panel. Lift the front panel up carefully as the panel components are connected to a Printed Circuit Assembly (PCA) by a wire harness. Verify that the connectors on the PCA are firmly seated. Check that the wire harnesses are soldered to the various connectors, controls, and speaker. There should be no loose wires in the system. Remove the fuse from the PCA. It is marked FH1 and is a cylindrical component. Verify that the fuse is good by checking the continuity with a multi-meter. If the fuse is open, replace with the same type: 3.15 Amp, 250V, Fast Acting. Close the front panel; re-install the screws and re-test the communicator. If the communicator still appears dead, contact Amron for further assistance.

5.5.4 LOW VOLUME

Check the volume control settings and adjust if necessary. Check the diver connections and verify that the diver and tender are connected as intended. Verify the wires and connector are clean and tight. Check the BATTERY CONDITION INDICATOR and test the battery if necessary. If the problem persists, disconnect the diver umbilical and perform the communicator check out procedure per section 5.1. If the communicator fails the check-out procedure, contact Amron for further assistance.

If the communicator checks out, then the problem is likely in either the diver umbilical communication cable, the wiring of the diving hat/helmet, or the diver's microphone/earphone.

5.5.5 GARBLED VOICE TO DIVER

The TENDER TO DIVER VOLUME control is set too high. Reduce this control until the voice signal clears. If this does not solve the problem, check the diver's earphone for corrosion or other defect. Replace if necessary. If the tender is using a headset, remove the headset and communicate to the diver by pressing the PUSH-TO-TALK BUTTON and talking into the PANEL SPEAKER. If this solves the problem then the tender headset may be wet or defective. If the tender is using the PANEL SPEAKER to talk to the diver, check the speaker for any accumulated water. Drain the speaker if necessary. If these steps do not solve the problem, then disconnect the diver umbilical and perform the communicator check out procedure per section 5.1. If the communicator fails the check-out procedure, contact Amron for further assistance. If the communicator checks out, then the problem is likely in the diver umbilical communication cable. If possible, substitute a known good cable to verify.

5.5.6 **GARBLED VOICE TO TENDER**

The DIVER TO TENDER VOLUME control is set too high. Reduce this control until the voice signal clears. If this does not solve the problem, check the diver's microphone for corrosion or other defect. Replace if necessary. If the tender is using a headset, remove the headset and listen to the diver using the PANEL SPEAKER. If this solves the problem then the tender headset may be wet or defective. If the tender is using the PANEL SPEAKER to talk to the diver, check the speaker for any accumulated water. Drain the speaker if necessary. If these steps have not solved the problem, then disconnect the diver umbilical and perform the communicator check out procedure per section 5.1. If the communicator fails the check-out procedure, contact Amron for further assistance. If the communicator checks out, then the problem is likely in the diver umbilical communication cable. If possible, substitute a known good cable to verify.

5.5.7 **DIVER CUTS OFF**

This is usually caused by an intermittent connection between either the umbilical and the diver communicator or the umbilical and the diver's hat/helmet. The intermittent connection could also be inside the diver's hat/helmet. Check all connections to verify that they are clean and tight. If the problem continues, substitute the communication cable with a known good cable. If this solves the issue, then the communication cable in the original umbilical is damaged and needs to be replaced or repaired. If none of these solutions fixes the problem, contact Amron for further assistance.

5.5.8 **FEEDBACK FULL DUPLEX (4-Wire) MODE**

There are two forms of feedback that can affect the communicator: acoustic feedback and cable crosstalk. Acoustic feedback occurs when an active microphone is close enough to pick up and amplify the signal from a speaker or earphone. The required distance between the microphone and speaker/earphone is dependent on the volume setting and the amount of acoustic isolation. For example, a tender headset left sitting on a work table may cause acoustic feedback. When the tender dons the headset at the same volume level, the acoustic feedback will no longer occur. The tender's head provides acoustic isolation between the microphone and earphone of the headset. The same is true for the diver's microphone and earphone.

To troubleshoot acoustic feedback issues first determine the source. One way to quickly determine the source of the acoustic feedback is to cover each active microphone with your hand, one at a time. Another method is to adjust the volume controls one at a time. The volume control that stops the feedback indicates the source. For example if the TENDER TO DIVER VOLUME control stops the feedback, then the problem is likely in the diver's hat/helmet. Common sources are feedback between the tender's headset microphone and the PANEL SPEAKER of the communicator. If the tender wants to operate with the headset and leave the PANEL SPEAKER on, Amron recommends the tender move away from the communicator by using the Amron Model 2822-28 Remote Walk-and-Talk Module.

This module provides an "extension" cord for the tender headset allowing the tender to operate away from the communicator.

Crosstalk is caused by signal leakage between the microphone and earphone wires in the umbilical cable. In a good cable with all the wires open (not connected), the resistance between any two wires should be greater than 10 Meg-Ohms. Over time, the cable can be damaged and this resistance drops to the point that crosstalk can occur. When this occurs, the communication cable in the umbilical should be replaced. For a temporary solution, you can try swapping the position of the diver earphone wires on the DIVER EARPHONE jack. If you are using a banana plug, simply unplug the diver earphone and rotate by 180 degrees before reconnecting. If this does not solve the problem and the umbilical cannot be immediately replaced, then operate in 2-Wire mode until a replacement umbilical can be used. Amron strongly recommends the use of the Amron CC1 communication cable. It has been specially designed for clear communications and long service life.

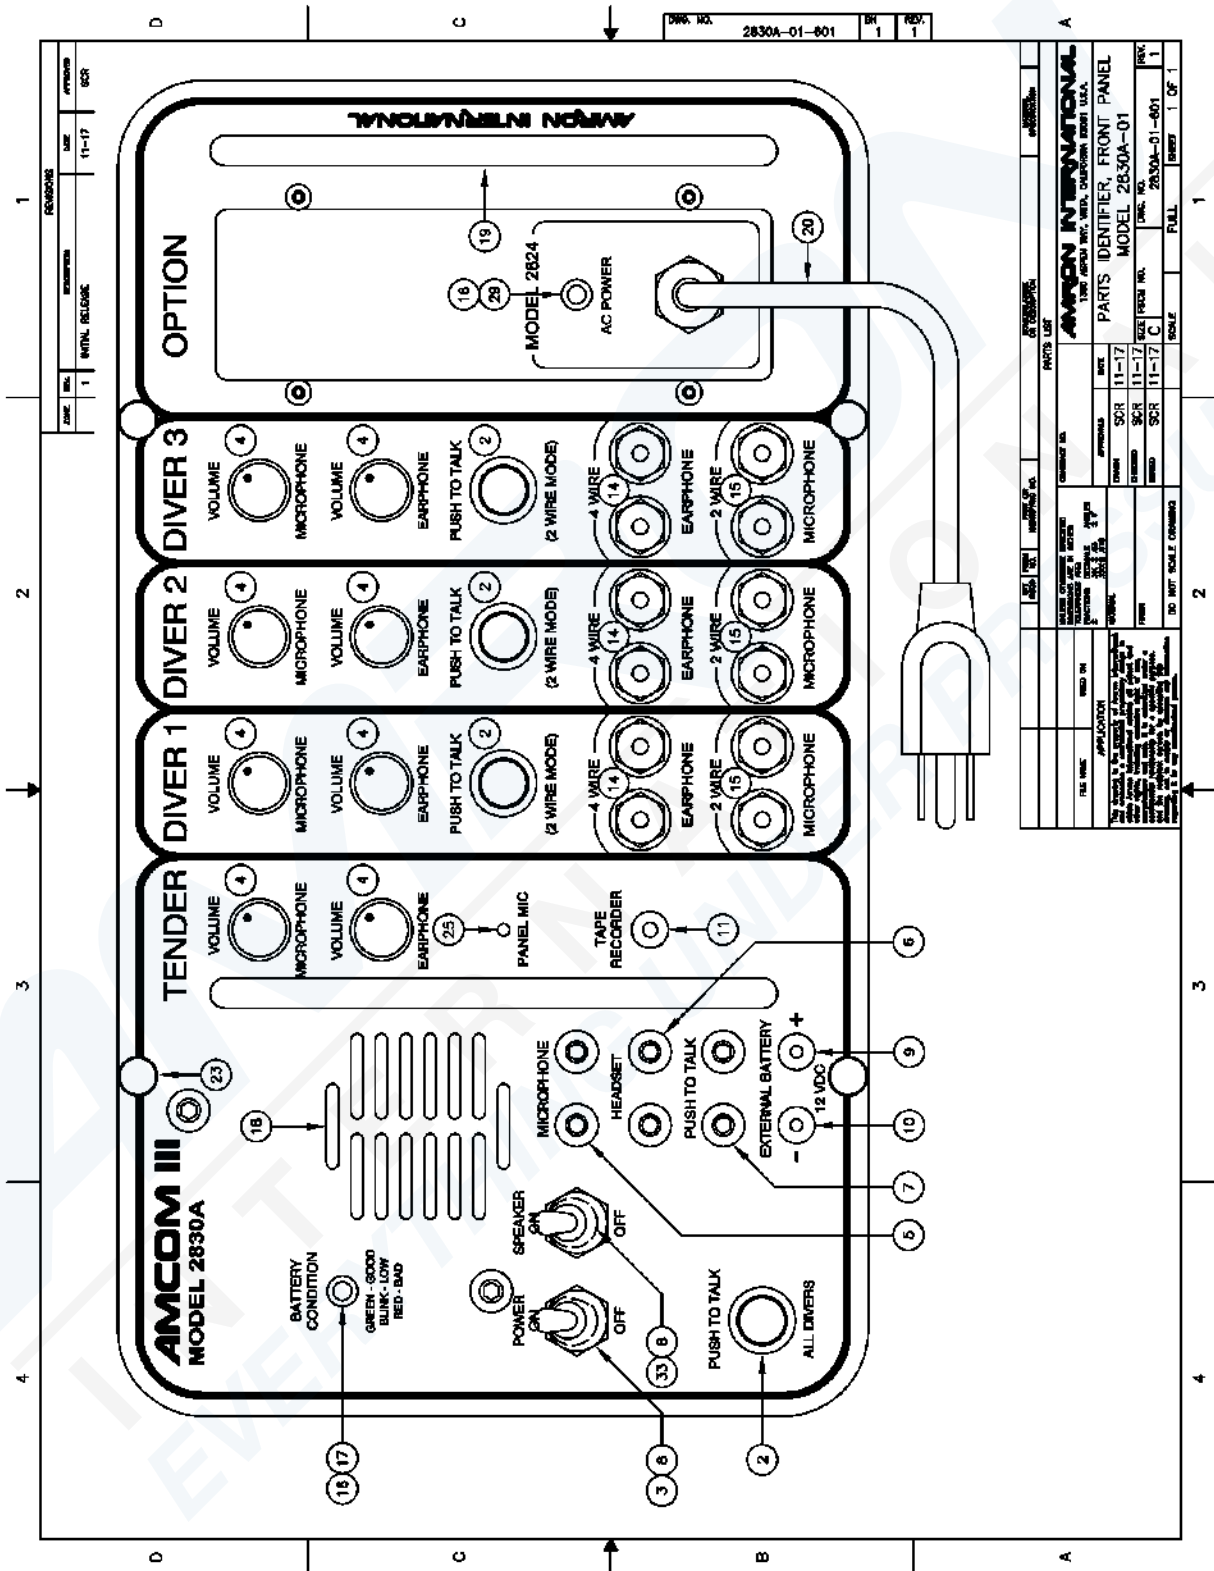

5.5.9 **PUSH-TO-TALK DOES NOT WORK**

If used, check the connection to the handheld microphone. A common issue is that the yellow banana plug is not properly seated in the PUSH-TO-TALK JACK. If the tender is using the PANEL SPEAKER as the microphone with the PUSH-TO-TALK BUTTON, make sure the SPEAKER SWITCH is turned on. If neither of these solves the problem, there could be a broken wire inside the diver communicator. Open the front panel and inspect. If that does not resolve the problem then contact Amron for further assistance.

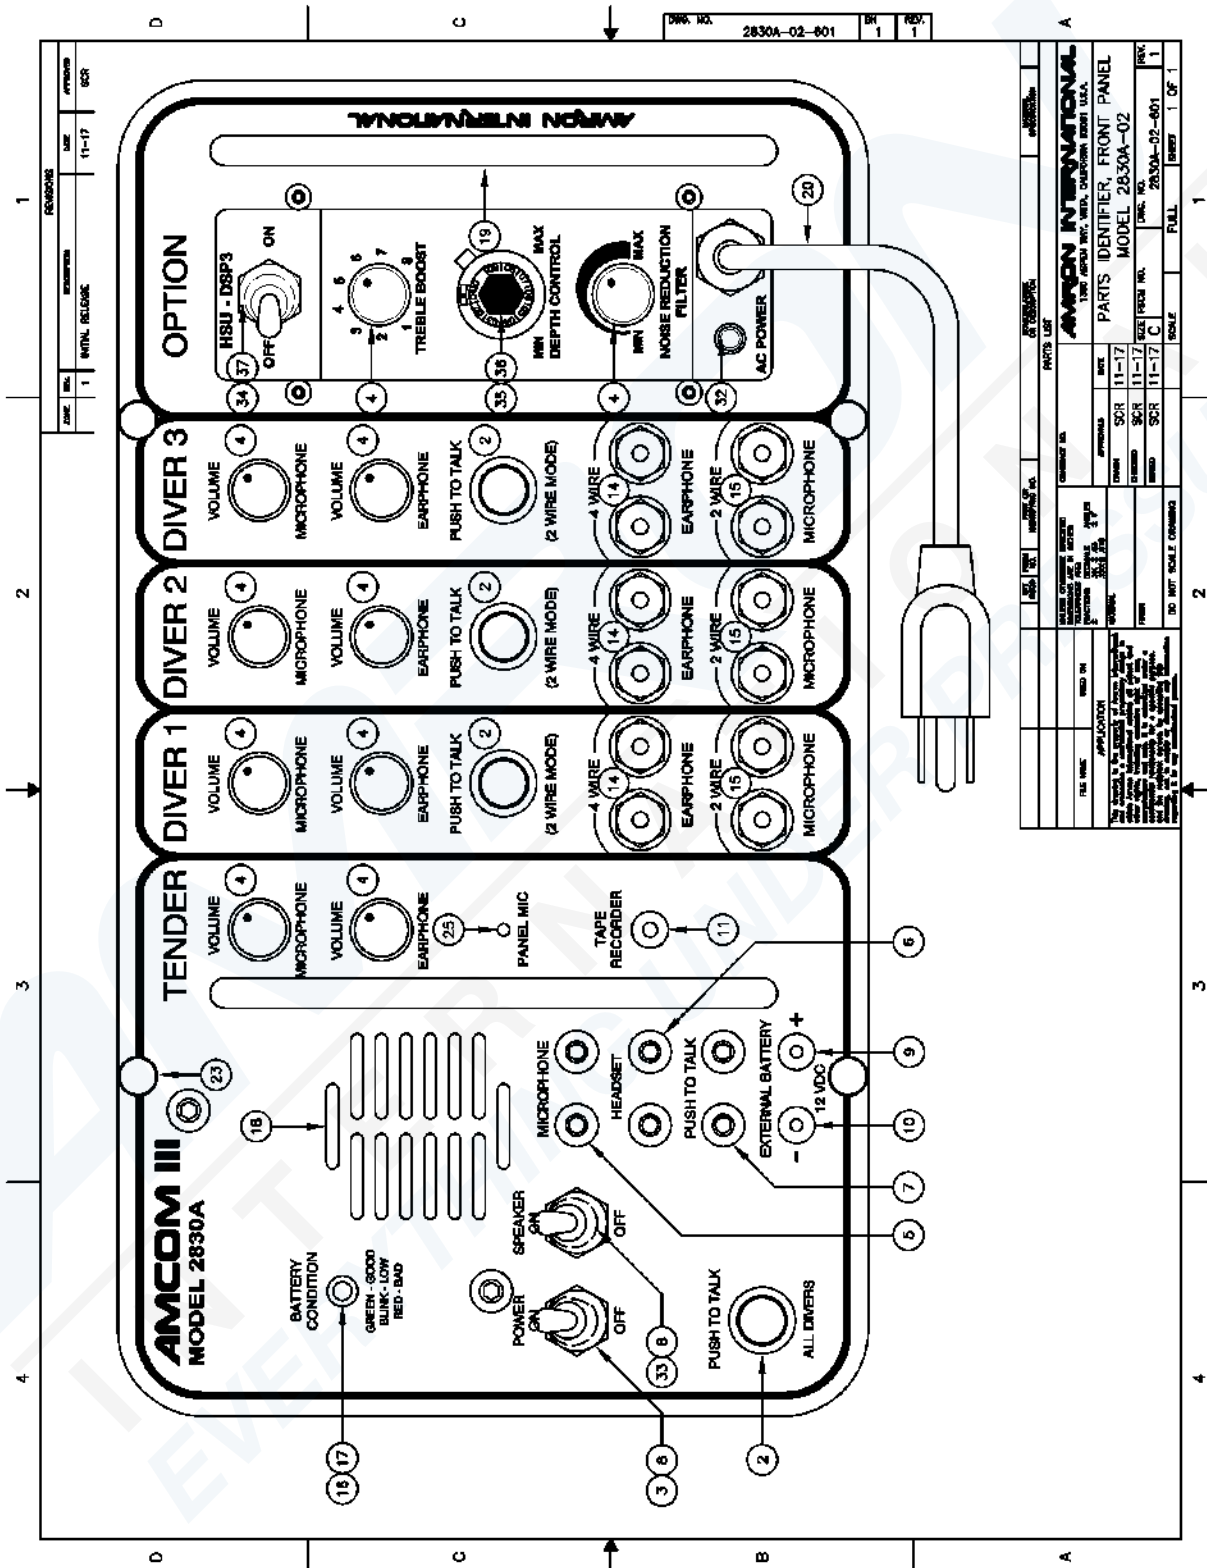

6 **DRAWINGS**

The reference numbers shown on the parts identifier drawings correspond to the parts lists listed in the parts lists section.

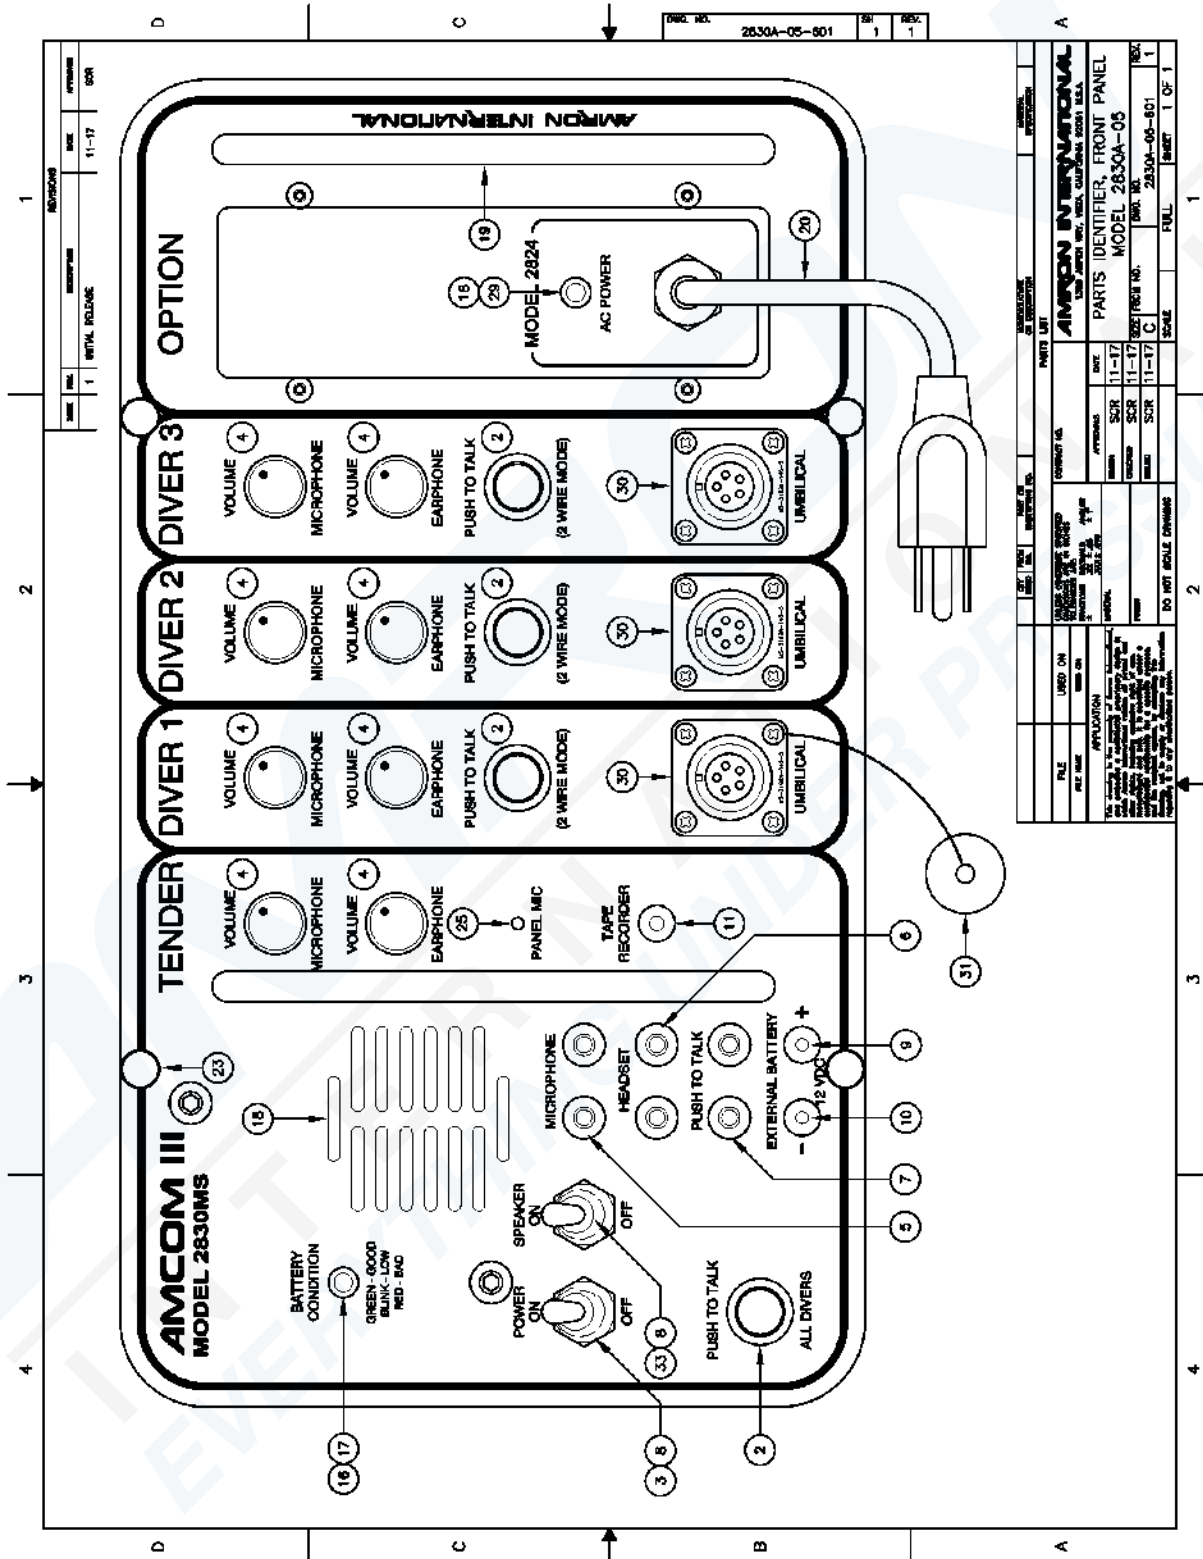

6.1 PARTS IDENTIFIER, MODEL 2830A-01, AC POWER WITH INTERNAL CHARGER

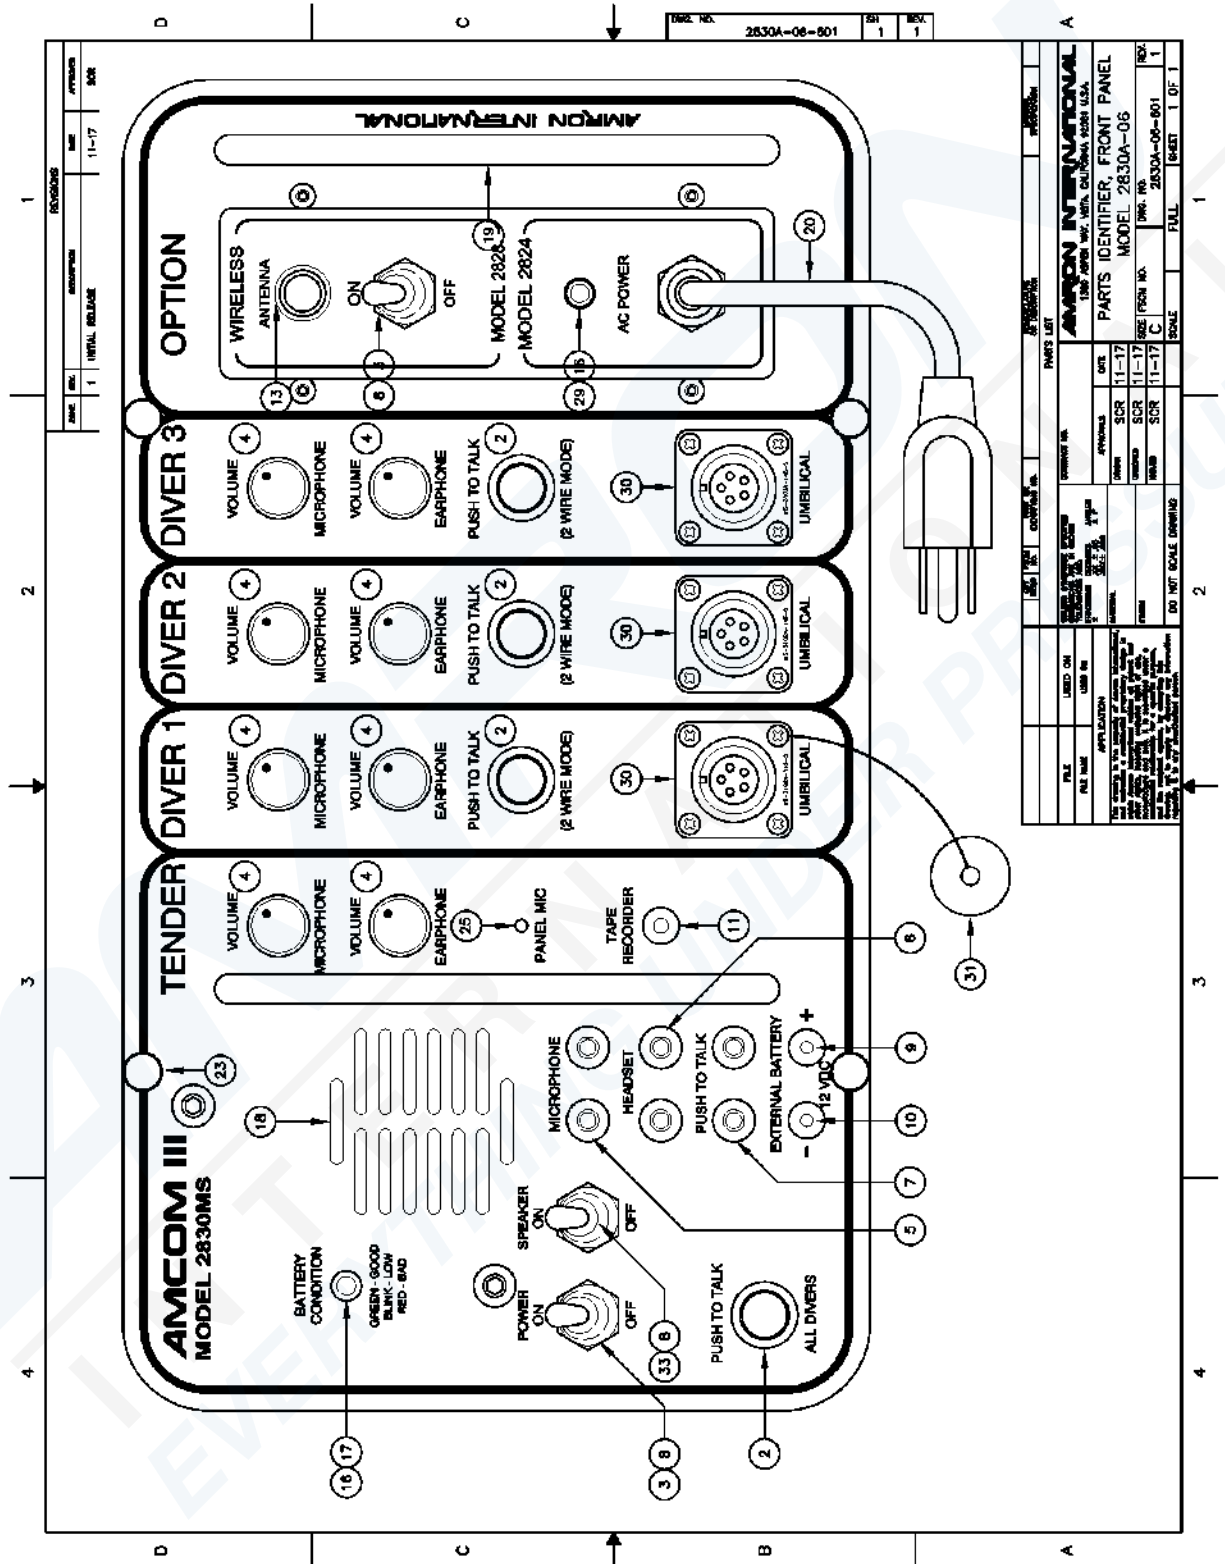

6.2 PARTS IDENTIFIER, MODEL 2830A-02, AC POWER, INTERNAL CHARGER & HSU-DSP3 HELIUM UNSCRAMBLER

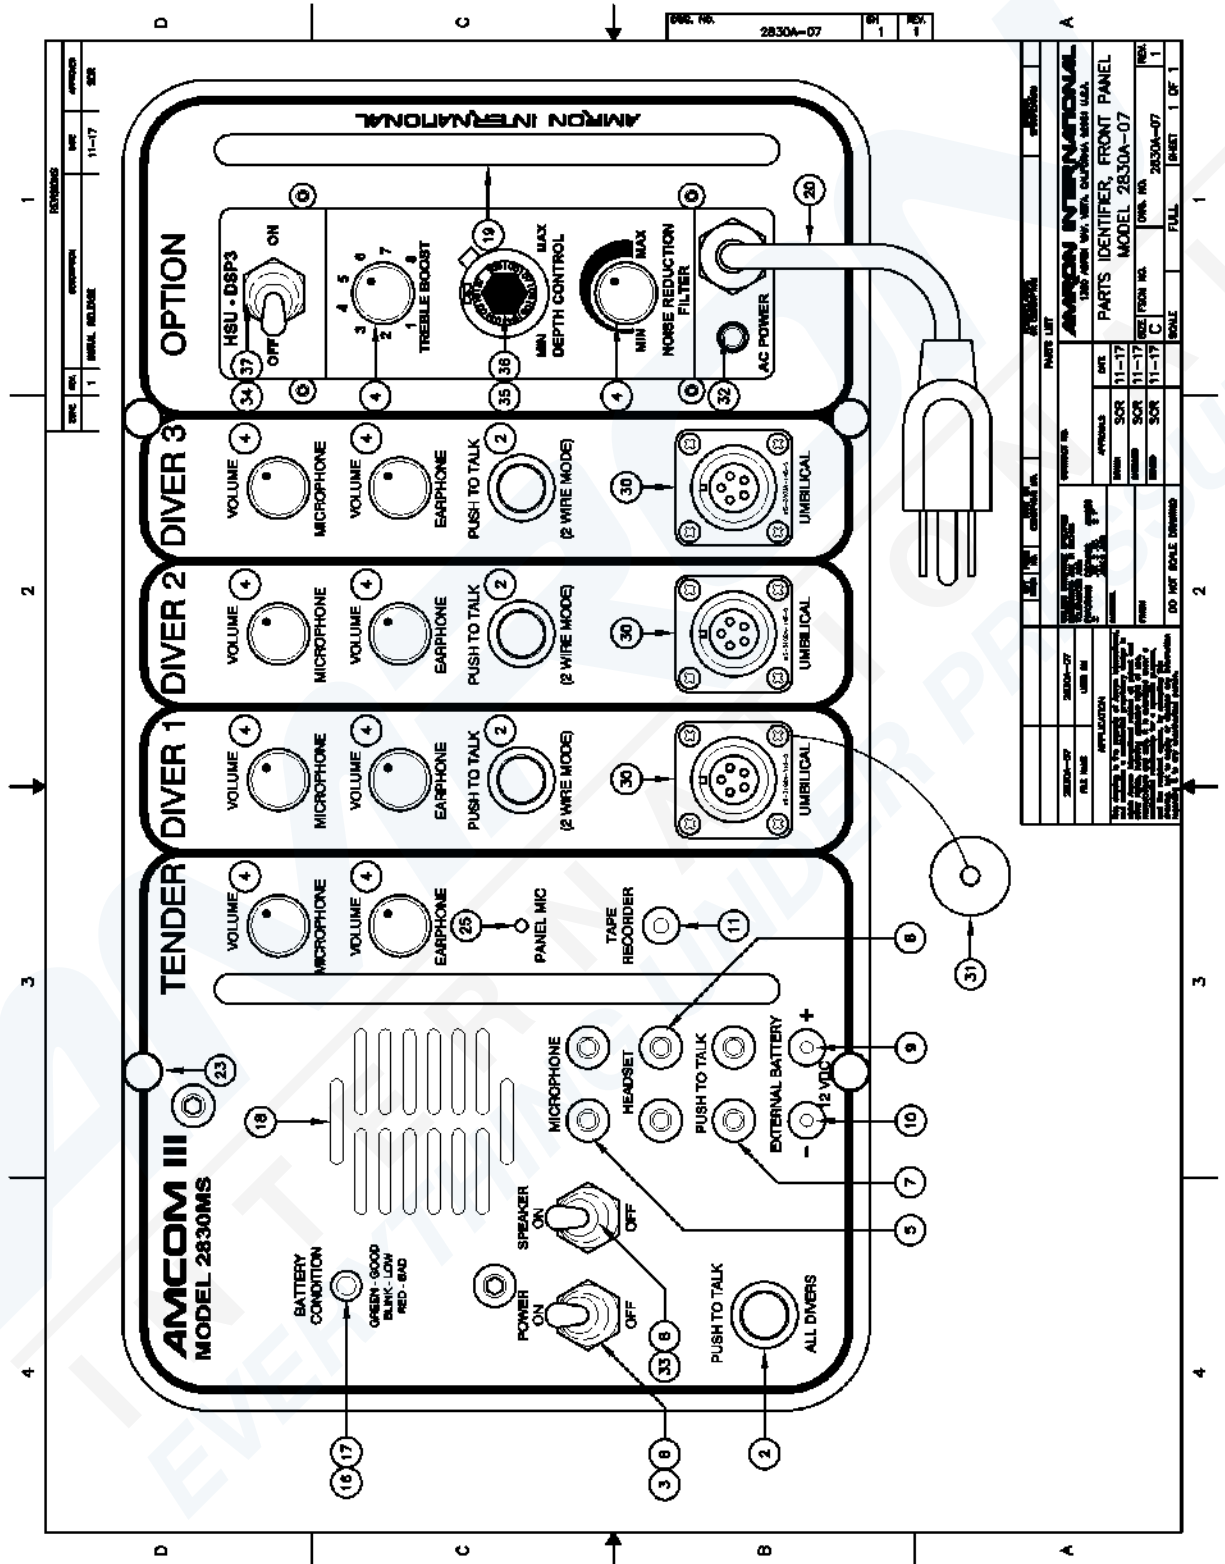

6.4 PARTS IDENTIFIER, MODEL 2830A-05, AC POWER, INTERNAL CHARGER & MS CONNECTORS

6.5 PARTS IDENTIFIER, MODEL 2830A-06, AC POWER, INTERNAL CHARGER, MS CONNECTORS & WIRELESS TENDER

6.6 PARTS IDENTIFIER, MODEL 2830A-07, AC POWER, INTERNAL CHARGER, MS CONNECTORS & HSU-DSP3 HELIUM UNSCRAMBLER

7 PARTS LISTS

The parts lists include both mechanical and electrical parts. The following information will be useful in interpreting data which is not self-explanatory.

REVISIONS

The parts lists in this manual are for the current model of diver communicator as of the printing date.

To Order Replacement Parts Contact:

Amron International, Inc.

1380 Aspen Way, Vista, California, 92081 U.S.A.

Telephone: (760) 208-6500 Fax: (760) 599-3857

Email: sales@amronintl.com

Web: www.amronintl.com

When ordering replacement parts, you should give as much information as possible to enable us to supply the correct part. This information should include the part number, description, reference designator, value, radio model number, and serial number. Failure to provide sufficient information may hinder our ability to fill your parts orders promptly and correctly.

7.1 FRONT PANEL PARTS IDENTIFIER FOR MODELS 2830A-01, 2830A-02, 2830A-03, 2830A-05 & 2830A-06

REF	PART NO.	DESCRIPTION
2	PBSWITCH	SWITCH PUSH BUTTON SEALED N.O
3	7580K6	SWITCH TOGGLE SPST
4	P16NP-10K	POTENTIOMETER 10K OHM W/KNOB
5	1498-102	JACK, BANANA RED
6	1498-103	JACK, BANANA BLACK
7	1498-107	JACK, BANANA YELLOW
8	5168	SEAL HALF BOOT TOGGLE GREY
9	105-0602-001	JACK, TIP RED
10	105-0603-001	JACK, TIP BLACK
11	ME161-2003	JACK, PHONO W/NYL WSHRS NKL/BLK
13	190-0000-01	ANTENNA 2.4GHZ
14	14002B	5-WAY BINDING POST (BLACK)
15	14002R	5-WAY BINDING POST (RED)
16	LEDHOLDER-BLK.25	MOUNTING CLIP FOR 5MM LED
17	LT2462-24-D51	LED, BI-COLOR RED/GREEN
18	SA818	SPEAKER 8 OHM 15 WATT
19	492	HANDLE ROUND 1.5X5.5X5/16
20	P-2392	CORD AC EURO 3 COND (7421.072)
23	8-32X3/4KTSB	SCREW KNURLED THUMB BRASS 3/4
25	24XX-MIC	MICROPHONE ASSY ELECTRET

REF	PART NO.	DESCRIPTION
29	LEDGREEN	LEDGREEN BRITE
30	MS-3112E-14-5S	CONNECTOR, BOX MOUNTING
31	MS-3181-14C	CAP, SEALING FOR RECEPTACLE
33	757-3522	SWITCH TOGGLE DPST ON-ON
34	SW-201	SWITCH TOGGLE ON/OFF DPDT
35	113-10K0-05	POTENTIOMETER; 10K OHM +/-5%
36	190-0500-15	KNOB; TURN-COUNTING DIAL
37	SWB-0001	BOOT TOGGLE SOFT GRAY

7.2 MODEL 2830A-01 AMCOM III DELUXE WITH AC POWER & INTERNAL CHARGER

PART NO.	DESCRIPTION
570-1008-30	3 DIVER AUDIO AMPLIFIER CARD
2820-301	CASE ASSEMBLY

8 LIMITED WARRANTY AND SERVICE POLICY

Amron International, Inc.

LIMITED WARRANTY & SERVICE POLICY

LIMITED WARRANTY

AMRON INTERNATIONAL, INC., (Amron) warrants that its manufactured products are free from defects in material and workmanship under normal use and service for a period of one year from date of shipment as described in Amron's literature covering this product. Oxygen Treatment Hoods and accessories are excluded and limited to 90 days. Amron's obligation under this warranty is limited to the repair or replacement, at Amron's option, of defective material. This warranty shall not cover defects which are the result of misuse, negligence, accident, repair or alterations.

SERVICE POLICY

For technical assistance or to request a repair, please complete one of the following:

- *Amron Communicator Repair* : <https://www.amronintl.com/communicator-repair-form>
- *Repair Request* (all other products): <https://www.amronintl.com/repair-form>
- Call (760) 208-6500, Monday – Friday, 8 a.m. to 5 p.m. PST.

Both MODEL NO. and SERIAL NO. are required fields to be entered on the *Amron Communicator Repair Request* form and can be found on the products identification label as shown below.

"Sample" Product Identification Label

Do not return any product without obtaining a RMR (Return Materials Request). Detailed return instructions will be provided at the time of request.
